

OpenAI's DALL-E 2: Top 5 New Results! ☐

OpenAI has unveiled its latest image generating AI, DALL-E 2, which uses a diffusion-based model to gradually transform noise into detailed images based on text inputs. This technology has the potential to revolutionize digital art and allow anyone to illustrate any novel. DALL-E 2 also features variant generation, image inpainting, and image outpainting capabilities, which are demonstrated through five outstanding examples. The AI is able to create high-quality inpaintings and outpaintings by filling in the holes or adding context to the image beyond what is visible in the initial frame. OpenAI plans to deploy this innovative technology to 1 million people in the near future, democratizing art creation for all.
