Regardez ChatGPT essayer de coder Flappy Bird avec l'IA

Watch ChatGPT attempt to program Flappy Bird with AI

A YouTuber decided to examine the capacities of artificial intelligence by requesting it to develop a video game. Without writing a single line of code, he tasked the AI with crafting a version of Flappy Bird. Following the AI's instructions, the game was eventually successfully created, albeit requiring some adjustments to correct errors. The AI also produced the game's graphics. The process was enlightening and allowed the YouTuber to concentrate on the game's design rather than the coding. Despite a few errors and necessary tweaks, the game ultimately operated properly. This experiment demonstrates that even novices can start using AI to build games, albeit requiring adjustments and oversight.
